

## ***A renewable energy battery charging solution***

Our compact, self contained wind-driven 'Windmill' is a welcome solution for any organisation seeking green energy credentials and reduced electricity bills.

The turbine will generate DC current from a low voltage 1.5kw generator. This will be stored in a battery pack at ground level and be used to provide stored power where it is needed. The windmill is ideal for water pumping and to replace the old fashioned windmills that are rusting away on farms around the world.

The Liberty windmill will operate in wind speeds of 130kph plus and does not require 'feathering'. The very strong patent applied blade structure provides a strong and reliable turbine for many years of working life.

Easily installed by 2 people. Hinged at base for ground level installation and any maintenance.

Will comply with OHS requirements

***The Liberty NRGPLUS WINDMILL  
offers many benefits over  
traditional windmills***

- The weight of the turbine is magnetically levitated and it floats on air with the only friction and future maintenance being on the turbine's shaft bearings.
- Silent operation.
- No vibration.
- This design allows wind to pass through it and becomes very stable in high winds.
- Fitted with regulator and dump load for high wind days.
- Pole anchored to ground with stability ties.
- Low maintenance.
- Easily installed by 2 people.
- Hinged for ground level access.
- Expected 20 year generator life.
- 5 year warranty on generator.
- Can be used for powering lights in off grid locations.
- Suitable for partnering with Solar.
- Potential for 24 hours a day operation on windy days.

***Special government subsidies  
might be available.***
